

Payment gateway integration with p2plus

Definition

1. Taker (User who places order on the advertisement)
2. Maker (User who posts advertisement)
3. Taker buy flow
 - a. Taker buyer (User who places order on the ad to buy crypto and pay fiat)
 - b. Maker seller (User who posts advertisement to sell crypto)
4. Taker sell flow
 - a. Taker seller (User who places order on the ad to sell crypto)
 - b. Maker buyer (User who posts advertisement to buy crypto and pay fiat)
5. Ad: P2P advertisement

Main steps – Taker buy flow

Step 0: Allow maker seller to post ad on Binance p2p platform

0.1: Binance creates new payment method, to allow maker using SAPI to upload payment account

0.2: Binance displays this new payment method to maker, and maker will see payment method with field “SAPI upload” type

0.3: Maker adds payment method in Binance

0.4: Maker deposits crypto in funding wallet

0.5: Maker posts advertisement to sell crypto

Step 1: Taker buyer places order

The buyer decides to purchase crypto using the Binance platform and finds the seller's advertisement. After reviewing the conditions, the buyer creates an order

The following information will be confirmed:

- A. Fiat unit and fiat amount
- B. Crypto unit and crypto amount
- C. Payment method

Order information will be recorded in Binance database.

Step 2: Maker seller queries order and passes additional KYC flow

2.1: Maker seller calls POST /sapi/v1/c2c/orderMatch/listOrders to query new orders

2.2: Maker seller calls POST /sapi/v1/c2c/orderMatch/getUserOrderDetail to get order details and userNo

If this userNo has passed verification previously, based on maker's own database, maker seller then calls POST /sapi/v1/c2c/orderMatch/verifiedAdditionalKyc to mark order as verified

If this userNo has not passed any verification

2.3: Maker seller calls 3rd party verification platform, to generate verification link and sends in chat using SAPI

2.4: Taker buyer clicks on the link, and passes additional verification

2.5: Maker seller calls POST /sapi/v1/c2c/orderMatch/verifiedAdditionalKyc to mark order as verified

2.6: Order enters "pending payment" status, wait maker to upload account detail

2.7: Taker buyer sees tips from order detail page, and wait for upload

Step 3: Maker seller uploads payment method

3.1: Maker seller calls 3rd party API to generate dynamic QR code / Virtual bank account

3.2: 3rd party provides dynamic QR code / Virtual bank account

3.3: Maker seller use new SAPI endpoint to upload account into p2p order detail page

3.4: P2P backend records in database

3.5: P2P backend pushes account to frontend

3.6: P2P frontend displays uploaded account in order detail page

3.7: Taker buyer makes payment

Step 4: Maker seller monitors payment and releases crypto

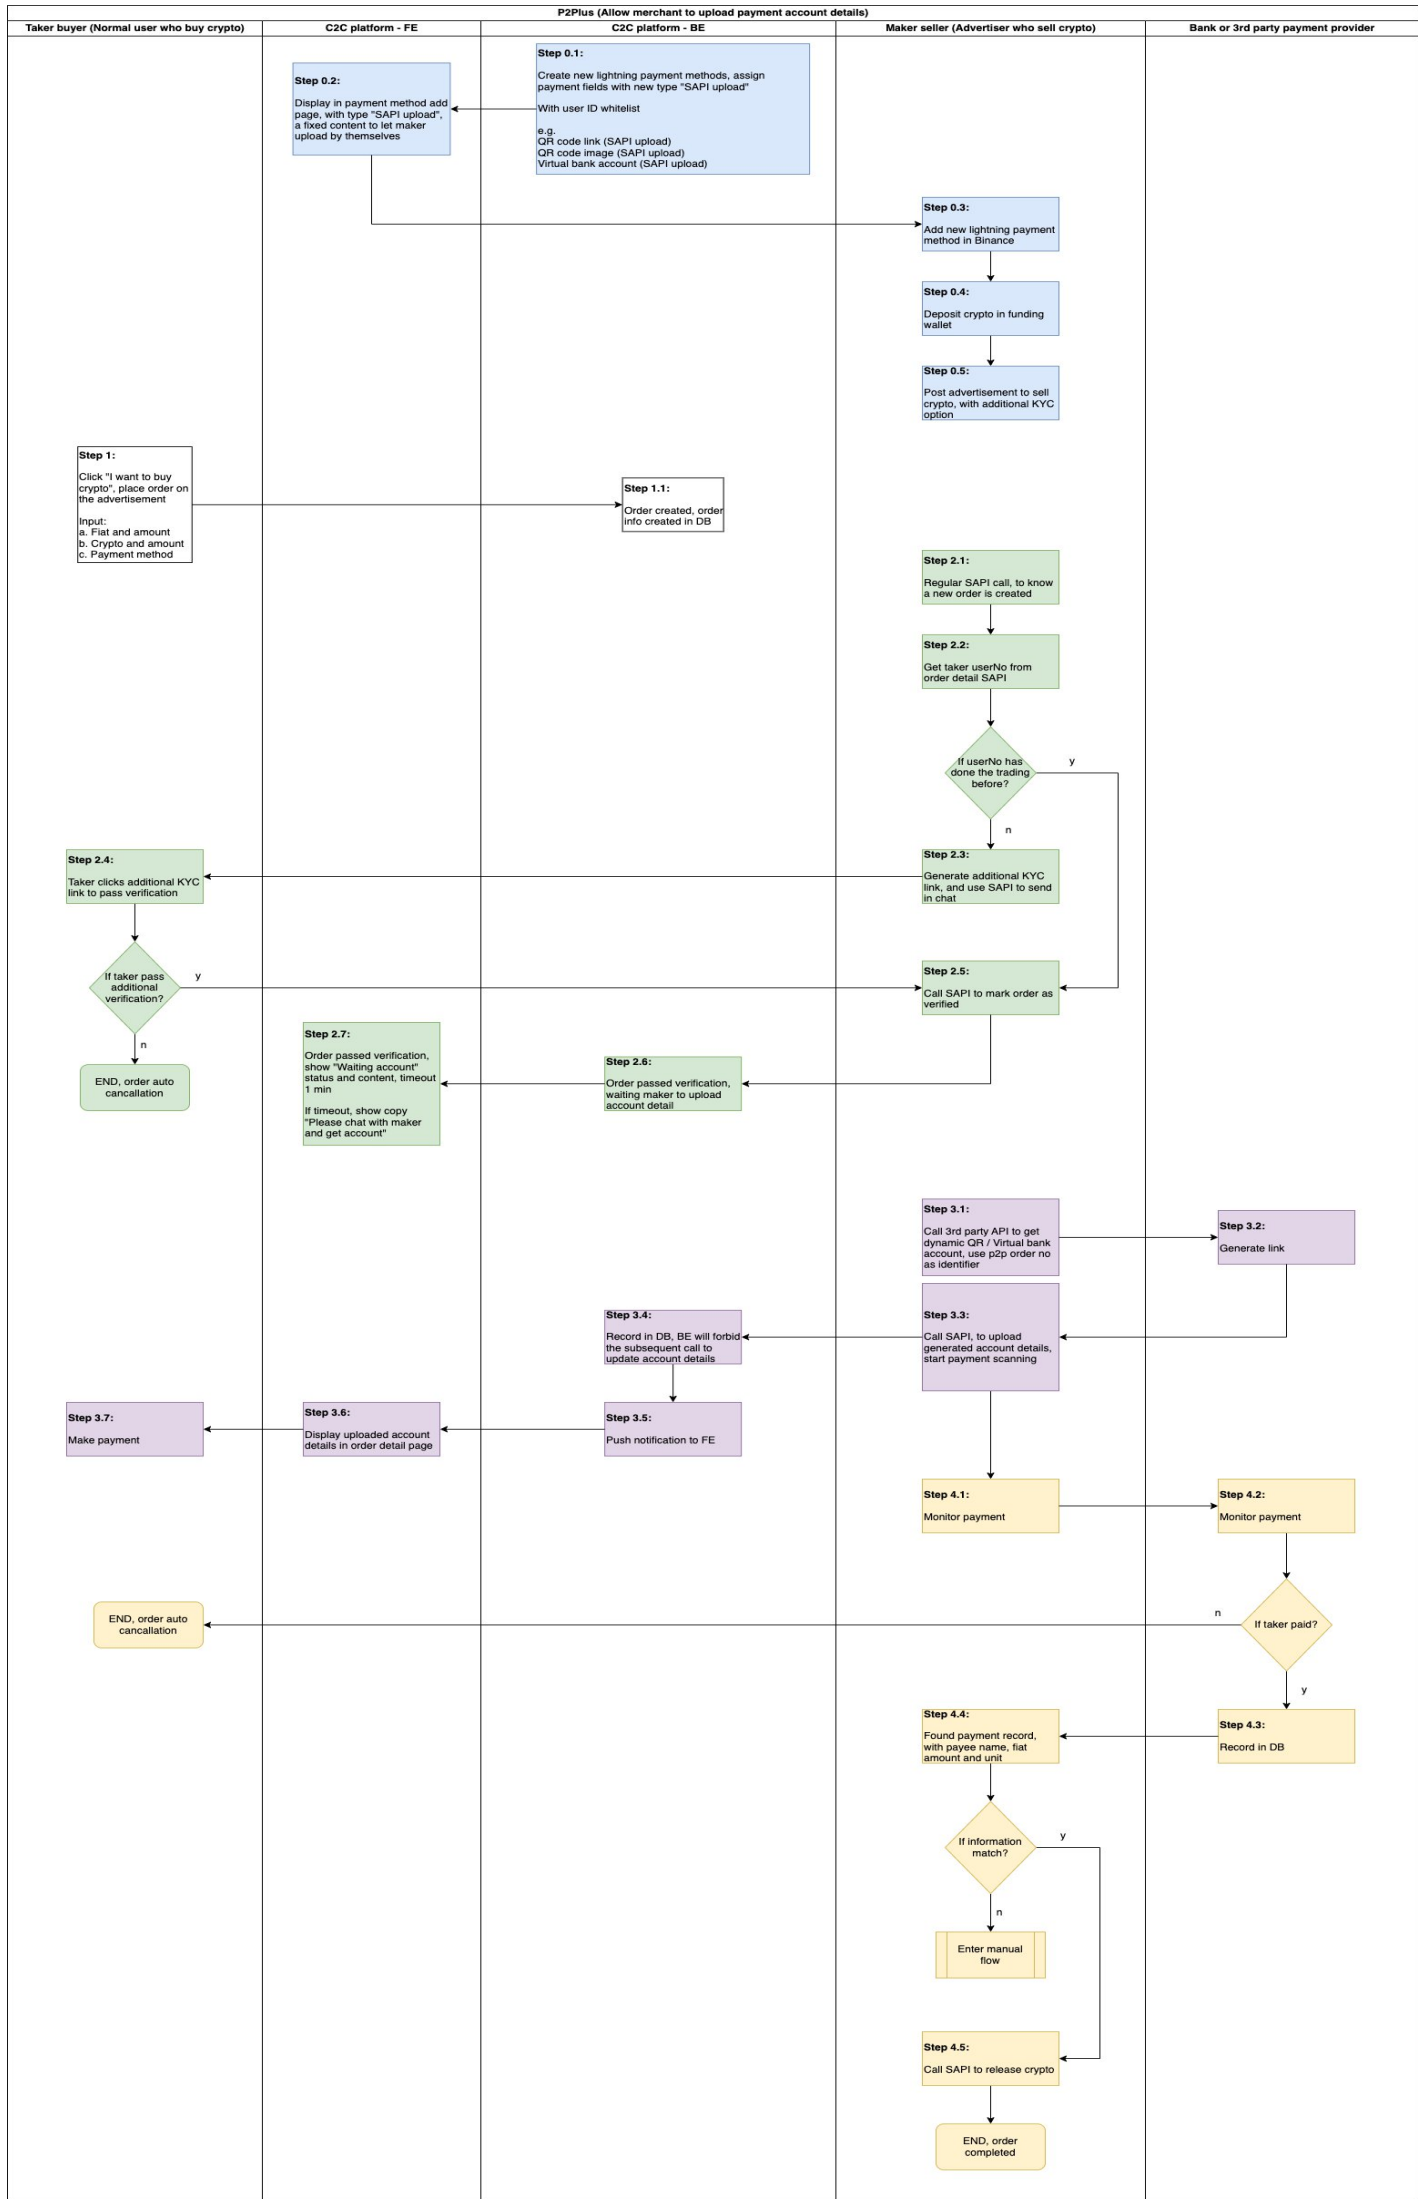

4.1: After uploading account, maker seller calls 3rd party API to monitor fiat payment

4.2: 3rd party starts to monitor

4.3: 3rd party found fiat transaction in database

4.4: Maker seller compares fiat amount, fiat unit and payer name

4.5: Maker seller calls SAPI to release crypto

Edge case handling – Taker buy

1. Taker buyer paid different fiat amount – Refund, or manually handle with taker buyer
2. Taker buyer paid using 3rd party account – Refund, or manually handle with taker buyer
3. Taker buyer didn't pay – Wait for system auto cancellation
4. Service down (either link generation/SAPI upload failed) – Offline ad and fix, created orders are waited for auto cancellation
5. Taker buyer claims chargeback – Enter CS flow, please feedback to Binance
6. Taker buyer's fund cause bank frozen – Enter CS flow, please feedback to Binance

Main steps – Taker sell flow

Step 0: Maker buyer posts ad on Binance p2p platform

0.1: Maker buyer adds payment method in Binance

0.2: Maker buyer posts maker buy ad

Step 1: Taker seller places order

The taker seller decides to sell crypto using the Binance platform and finds the buyer's advertisement. After reviewing the conditions, the seller creates an order

The following information will be confirmed:

- A. Fiat unit and fiat amount
- B. Crypto unit and crypto amount
- C. Payment method

Order information will be recorded in Binance database.

Step 2: Maker buyer queries order and passes additional KYC flow

2.1: Maker buyer calls POST /sapi/v1/c2c/orderMatch/listOrders to query new orders

2.2: Maker buyer calls POST /sapi/v1/c2c/orderMatch/getUserOrderDetail to get order details and userNo

If this userNo has passed verification previously, based on maker's own database, maker buyer then calls POST /sapi/v1/c2c/orderMatch/verifiedAdditionalKyc to mark order as verified

If this userNo has not passed any verification

2.3: Maker buyer calls 3rd party verification platform, to generate verification link and sends in chat using SAPI

2.4: Taker seller clicks on the link, and passes additional verification

2.5: Maker buyer calls POST /sapi/v1/c2c/orderMatch/verifiedAdditionalKyc to mark order as verified

Step 3: Maker buyer conducts payment

3.1: Maker buyer calls 3rd party API to do fiat payout

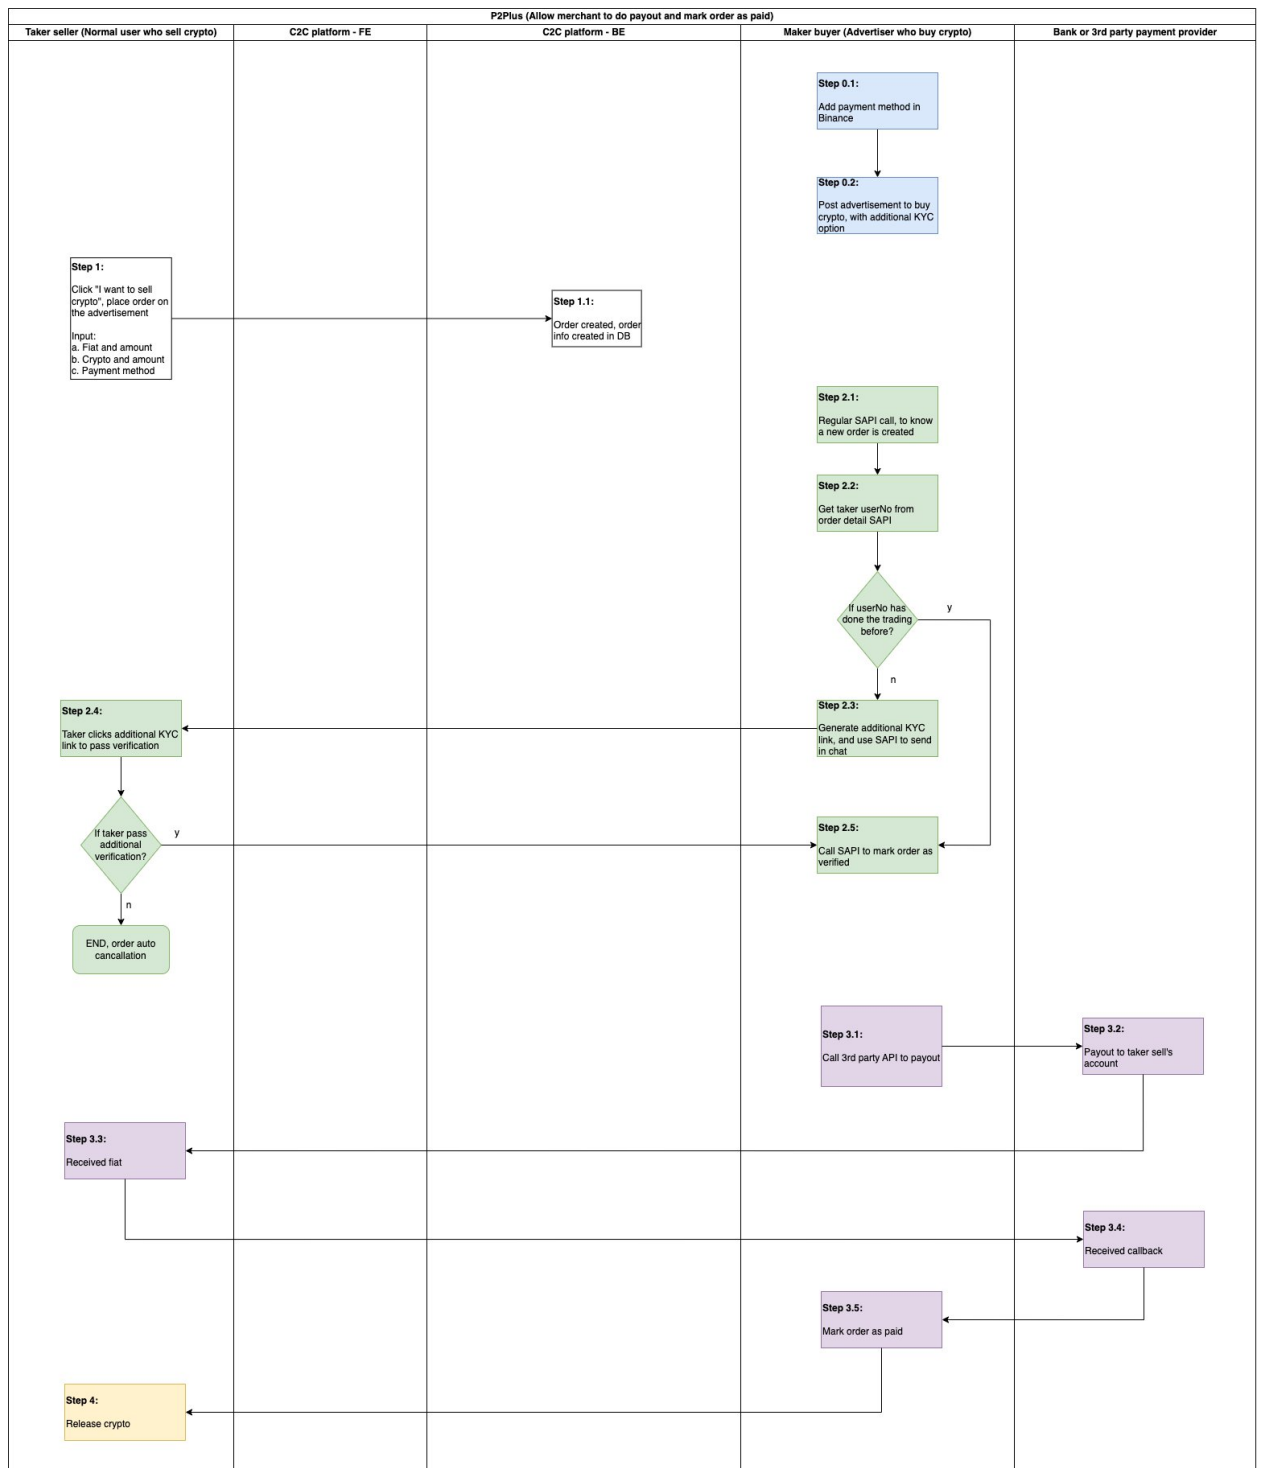

3.2: 3rd party pays to taker seller's account

3.3: Taker seller receives fiat payment

3.4: 3rd party gets callback and informs maker buyer

3.5: Maker buyers calls /sapi/v1/c2c/orderMatch/markOrderAsPaid to mark order as paid

Step 4: Taker seller releases crypto

Edge case handling – Taker sell

1. Taker seller provides invalid account – Enter manual flow
2. Taker seller wants to change to another account – Enter manual flow
3. Taker seller provides valid account, but belongs to 3rd party – Enter manual flow
4. Taker seller provides multiple accounts – Enter manual flow
5. Taker seller's account is frozen - Enter manual flow, please feedback to Binance
