

Use fund password to release order in SAPI

Step 1: Get public key from SAPI

GET /sapi/v1/c2c/cryptography/rsa-public-key

Sample response:

```
{
  "code": "000000",
  "message": "success",
  "data": "xxxxx", //public key
  "success": true
}
```

Step 2: Encrypt your own func password using the following method

"content" is your original fund password string

"publicKeyString" is the key your get from the **response field "data"** after calling GET /sapi/v1/c2c/cryptography/rsa-public-key

Sample code to do encryption in your local machine:

```
public static String encrypt(String content, String publicKeyString) throws Exception {
    if (StringUtils.isEmpty(new CharSequence[]{content, publicKeyString})) {
        throw new IllegalArgumentException("invalid content or privateKey.");
    } else {
        Cipher cipher = Cipher.getInstance("RSA/ECB/OAEPWITHSHA-256ANDMGF1PADDING", "BC");
        cipher.init(1, getPublicKey(publicKeyString));
        return Base64.encodeBase64String(cipher.doFinal(content.getBytes("UTF-8")));
    }
}
```

Step 3: Use encrypted fund password to release order in SAPI

POST /sapi/v1/c2c/orderMatch/releaseCoin

Sample payload:

```
{
  "authType": "FUND_PWD",
  "code": "....", // Encrypted fund password in step 2
  "orderNumber": "....",
  "payId": "....",
  "confirmPaidType": "normal" (normal: when order status is 2 - Buyer paid)
}

{
  "authType": "FUND_PWD",
  "code": "....", // Encrypted fund password in step 2
  "orderNumber": "....",
  "payId": "....",
  "confirmPaidType": "quick" (normal: when order status is 1 - Pending buyer payment)
}
```
